

SKF Power Transmission belts

where:
 n = number of teeth in mesh
 D = large pulley diameter (mm)
 d = small pulley diameter (mm)
 C = pitch circle diameter of teeth on small pulley

on page 130 for
correction factor C_v

$$n = \frac{D-d}{p} + 2$$

Example:
Required belt basic power rating is:

$$P_b = \frac{50 \text{ kW}}{(1,0 \times 1,0)} = 50 \text{ kW}$$

Selected belt width $W_b = 54,9 \text{ kW} > 50 \text{ kW}$

A well designed belt drive will transmit power for many years with a minimum of maintenance. Although they have been around for a long time, belts are still a very efficient and cost-effective method for transmitting power from one component to another.

The evolution of belts has been remarkable. New materials, designs and manufacturing methods have increased working load limits and extended belt life.

SKF offers a complete assortment of both standard and high performance belts that can be implemented in many different applications.

The most common V and timing belts are part of this manual. The power ratings listed here are the same as those used in our software programs. However, there will be small differences in the results because the software will interpolate values if speeds or diameters fall between those listed in the tables. As a result, SKF recommends using the belt selection program available for download at www.skfptp.com.

About the data in this catalogue

The data in this catalogue relates to SKF's state-of-the-art technology as of the beginning of 2011. The data may differ from that shown in earlier catalogues because of revised methods of calculation, redesign or technological developments.

SKF reserves the right to make continuing improvements to SKF products with respect to materials, design and manufacturing methods, as well as changes necessitated by technological developments.

Other Power Transmission catalogues

Product information is also available via the SKF Power Transmission products website at www.skfptp.com. The website does not only provide product information, but also online calculation tools, drawings, and search and selection functions.

The main printed SKF Power Transmission catalogues are:

- SKF Transmission chain catalogue
- SKF Couplings catalogue
- SKF FX Keyless Bushings catalogue
- SKF Xtra Power Belts catalogue

For more information about SKF Power Transmission products, contact your local SKF representative or SKF Authorized Distributor.

SKF – the knowledge engineering company

From one simple but inspired solution to a misalignment problem in a textile mill in Sweden, and fifteen employees in 1907, SKF has grown to become a global industrial knowledge leader.

Over the years, we have built on our expertise in bearings, extending it to seals, mechatronics, services and lubrication systems. Our knowledge network includes 46 000 employees, 15 000 distributor partners, offices in more than 130 countries, and a growing number of SKF Solution Factory sites around the world.

Research and development

We have hands-on experience in over forty industries based on our employees' knowledge of real life conditions. In addition, our world-leading experts and university partners pioneer advanced theoretical research and development in areas including tribology, condition monitoring, asset management and bearing life theory. Our ongoing commitment to research and development helps us keep our customers at the forefront of their industries.

Meeting the toughest challenges

Our network of knowledge and experience, along with our understanding of how our core technologies can be combined, helps us create innovative solutions that meet the toughest of challenges. We work closely with our customers throughout the asset life cycle, helping them to profitably and responsibly grow their businesses.

Working for a sustainable future

Since 2005, SKF has worked to reduce the negative environmental impact from our operations and those of our suppliers. Our continuing technology development resulted in the introduction of the SKF BeyondZero portfolio of products and services which improve efficiency and reduce energy losses, as well as enable new technologies harnessing wind, solar and ocean power. This combined approach helps reduce the environmental impact both in our operations and our customers' operations.

SKF Solution Factory makes SKF knowledge and manufacturing expertise available locally to provide unique solutions and services to our customers.

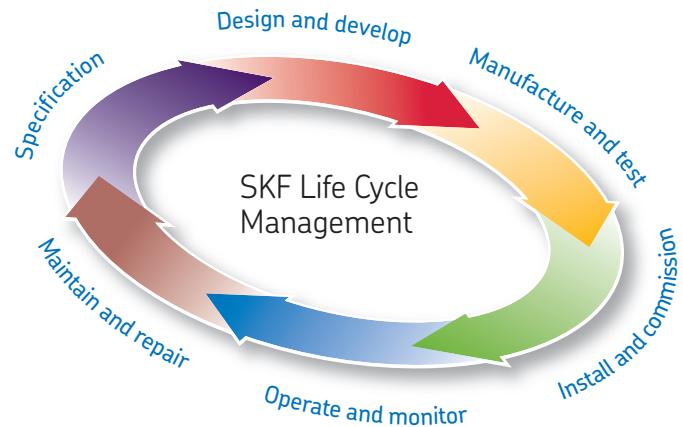

Working with SKF IT and logistics systems and application experts, SKF Authorized Distributors deliver a valuable mix of product and application knowledge to customers worldwide.

Our knowledge – your success

SKF Life Cycle Management is how we combine our technology platforms and advanced services, and apply them at each stage of the asset life cycle, to help our customers to be more successful, sustainable and profitable.

Working closely with you

Our objective is to help our customers improve productivity, minimize maintenance, achieve higher energy and resource efficiency, and optimize designs for long service life and reliability.

Innovative solutions

Whether the application is linear or rotary or a combination, SKF engineers can work with you at each stage of the asset life cycle to improve machine performance by looking at the entire application. This approach doesn't just focus on individual components like bearings or seals. It looks at the whole application to see how each component interacts with each other.

Design optimization and verification

SKF can work with you to optimize current or new designs with proprietary 3-D modelling software that can also be used as a virtual test rig to confirm the integrity of the design.

Bearings

SKF is the world leader in the design, development and manufacture of high performance rolling bearings, plain bearings, bearing units and housings.

Machinery maintenance

Condition monitoring technologies and maintenance services from SKF can help minimize unplanned downtime, improve operational efficiency and reduce maintenance costs.

Sealing solutions

SKF offers standard seals and custom engineered sealing solutions to increase uptime, improve machine reliability, reduce friction and power losses, and extend lubricant life.

Mechatronics

SKF fly-by-wire systems for aircraft and drive-by-wire systems for off-road, agricultural and forklift applications replace heavy, grease or oil consuming mechanical and hydraulic systems.

Lubrication solutions

From specialized lubricants to state-of-the-art lubrication systems and lubrication management services, lubrication solutions from SKF can help to reduce lubrication related downtime and lubricant consumption.

Actuation and motion control

With a wide assortment of products – from actuators and ball screws to profile rail guides – SKF can work with you to solve your most pressing linear system challenges.

SKF Wrapped Wedge and Narrow Wedge Belts

Construction details

Cushion rubber

Cushion rubber provides good adhesion between the tension members (cords) and the rubber cushion.

Tension members

The tension cords are made from polyester yarn. Pre-loading the cords during their rubber impregnation process results in low stretch during operation.

Rubber cushion

The rubber cushion is a fibre loaded giving good transverse belt rigidity.

Wrapping fabric

Heavy duty industrial fabric.

Features:

- High transverse rigidity minimizes heat generation
- Chloroprene rubberized wrapping fabric resists abrasion
- Moderately oil-resistant
- Temperature range from -35 to +65 °C
- Belts are anti-static per ISO 1813
- Constant length per ISO matching set tolerances

Applications

SKF Wrapped and Narrow Wedge Belts have been designed to accommodate all industrial applications and some agricultural machines.

Standards

ISO 4184

SKF Wrapped Wedge Belts used in the mining industry

SKF Xtra Power Narrow Wedge Belts

Construction details

Cushion rubber

Cushion rubber provides good adhesion between the rubber cushion and cords.

Tension members

The tension cords are made from polyester yarn. Pre-loading the cords during their rubber impregnation process results in low stretch during operation.

Tension member wrapping

A fibre filled compound encases the tension members thus enabling the belts to accommodate higher dynamic loads without compromising flexibility.

Rubber cushion

The rubber cushion is fibre loaded giving good transverse belt rigidity.

Wrapping fabric

Heavy duty industrial fabric.

Features:

- High transverse rigidity minimizes heat generation
- Chloroprene rubberized wrapping fabric resists abrasion
- Moderately oil-resistant
- Temperature range from -35 to +65 °C
- Belts are anti-static per ISO 1813
- Constant length per ISO matching set tolerances

Applications

SKF Xtra Power Wrapped Wedge and SKF Narrow Wedge Belts have been designed to deliver up to 40% more power than standard wrapped belts. They are suitable for all kinds of industrial applications and some agricultural machines.

Standards

ISO 4184

SKF Wrapped Classical Belts

Construction details

Cushion rubber

Cushion rubber provides good adhesion between the tension members (cords) and the rubber cushion.

Tension members

The tension cords are made from polyester yarn. Pre-loading the cords during their rubber impregnation process results in low stretch during operation.

Rubber cushion

The rubber cushion is fibre loaded giving good transverse belt rigidity.

Wrapping fabric

Heavy duty industrial fabric.

Features:

- High flexibility
- Chloroprene rubberized wrapping fabric resists abrasion
- Moderately oil-resistant
- Temperature range from -35 to +65 °C
- Belts are anti-static per ISO 1813
- Constant length per ISO matching set tolerances

Applications

SKF Wrapped Classical Belts have been developed to handle the majority of industrial applications and some agricultural machines. They can run on ISO wedge as well as on classical V-belt pulleys. Suitable for V-flat drives (flying wheel applications).

Standards

ISO 4184

SKF Wrapped Classical Belts

SKF Wrapped Classical Belts used in the HPI, Oil and gas industry

Construction details

Cushion rubber

Cushion rubber provides good adhesion between the tension members (cords) and the rubber cushion.

Tension members

The tension cords are made from polyester yarn. Pre-loading the cords during their rubber impregnation process results in low stretch during operation.

Rubber cushion

The rubber cushion is fibre loaded chloro-prene compound giving good transverse belt rigidity.

Backside fabric

Heavy duty industrial fabric.

Features:

- High transverse rigidity
- High flexibility
- Temperature range from -30 to +75 °C
- Constant length per ISO matching set tolerances.
- Suitable for tropical climates
- Lengths available up to 3 500 mm

Applications

SKF Cogged Raw Edge Wedge and SKF Cogged Raw Edge Narrow Wedge Belts have been developed to handle all industrial applications.

SKF Cogged Raw Edge Wedge Belts in the metal industry

SKF Cogged Raw Edge Classical Belts

Construction details

Cushion rubber

Cushion rubber assures good adhesion between cushion and cord.

Tension members

The tension members (cords) are made from polyester yarns. Pre-tension of cord during impregnation process gives low stretch of the belt on application.

Rubber cushion

Rubber cushion is fibre loaded chloroprene compound giving good transverse belt stiffness.

Backside fabric

Heavy duty industrial fabric.

Features:

- Very high flexibility
- Temperature range from -30 to +75 °C
- Constant length per ISO matching set tolerances.
- Suitable for tropical climates
- Lengths available up to 3 500 mm

Applications

SKF Cogged Raw Edge Classical Belts have been developed to handle the majority of industrial applications running on ISO wedge as well as on classical V-belt pulleys.

Standards

ISO 4184

SKF Cogged Raw Edge Classical Belts in the energy industry

Industrial V and wedge belts

SKF belts allow for overall length tolerances according to ISO 4184.

Manufacturing tolerances of V-belts

Nominal length (L)		Permissible deviation for sections Y, Z, A, B, C, D, E		
over	incl.	+	-	
mm		mm		mm
-	250	+8	-4	
250	315	+9	-4	
315	400	+10	-5	
400	500	+11	-6	
500	630	+13	-6	±6
630	800	+15	-7	±8
800	1 000	+17	-8	±10
1 000	1 250	+19	-10	±13
1 250	1 600	+23	-11	±16
1 600	2 000	+27	-13	±20
2 000	2 500	+31	-16	±25
2 500	3 150	+37	-18	±32
3 150	4 000	+44	-22	±40
4 000	5 000	+52	-26	±50
5 000	6 300	+63	-32	±63
6 300	8 000	+77	-38	±80
8 000	10 000	+93	-46	±100
10 000	12 500	+112	-56	±125
12 500	16 000	+140	-70	
16 000	20 000	+170	-85	

However, within particular sizes, belts meet matching set tolerances, which make them set free.

Belt matching tolerances

Nominal length (L)	Maximum difference between the lengths of belts of the same set for sections Y, Z, A, B, C, D, E	
	mm	mm
L ≤ 1 250	2	2
1 250 < L ≤ 2 000	4	2
2 000 < L ≤ 3 150	8	4
3 150 < L ≤ 5 000	12	6
5 000 < L ≤ 8 000	20	10
8 000 < L ≤ 12 500	32	16
12 500 < L ≤ 20 000	48	-

Selection guide for SKF V-belts

Selection procedure and formulae

Example:

Driver: 45 kW electric motor, 1 440 r/min, direct online start.

Driven: Fan, 550 r/min

Service: 24 hours/day

Approximate distance between centres = 900 mm

Tensioning method: SKF pen tester

1 Service factor (C_2)

Service factors describe the severity of drive conditions. Refer to **tables 2 and 3** on **page 16**.

Example: Medium duty class, heavy start

$$C_2 = 1,4$$

For speed increasing drives, use correction factors in **table 1** on **page 16**.

2 Design power (P_d)

Multiply drive power and service factor C_2 to get the design power.

$$P_d = P_r C_2$$

where

P_d = design power [kW]

P_r = motor rated power or power absorbed by the load [kW]

C_2 = service factor

Example:

$$P_d = 45 \times 1,4 = 63 \text{ kW}$$

3 Belt cross section

Refer to **diagrams 1, 2, 3** on **pages 17 and 18** for the appropriate belt cross section based on speed and design power.

Example: Selected section SPB

4 Required speed ratio (I_r)

Divide speed of faster shaft with speed of slower shaft to get the required pulley speed ratio.

$$I_r = \frac{\text{r/min (faster shaft)}}{\text{r/min (slower shaft)}}$$

Example:

$$I_r = \frac{1\,440}{550} = 2,62$$

5 A. If selected cross section is SPA/SPA-XP/XPA, SPB/SPB-XP/XPB, SPC/SPC-XP/XPC, 5V/5V-XP/5VX or 8V/8V-XP

Choose the corresponding centre distance based on the required speed ratio by referring to **tables 4a to 4p** on **pages 20 to 35** to get:

Belt datum length (L_d)
Centre distance (CC)
Datum diameter of pulleys (d, D)

Example: Centre distance table for section SPB is available on **pages 23, 24** and **25**.

Speed ratio: 2,62
Belt datum length: 2 990 mm
Centre distance: 941 mm
D = 500 mm
d = 190 mm

Continue with **step 10**.

5 B. If another type of V-belt is selected, where centre distance tables are not available

Continue with **step 6**.

6 Pulley datum diameters (d, D)

Try to use standard pulley diameters.

– Refer to **table 5a** or **6a** on **pages 36 to 39** to get the recommended diameter for small pulleys (d)

– Refer to speed ratio **table 5b** or **6a** on **pages 36 to 39** to get the diameter for large pulleys (D)

7 Centre distance preliminary (CCp)

Determine preliminary centre distance between pulleys.

Recommended: CCp min: 0,7 (D + d)
CCp max: 2 (D + d)

where

D = large pulley diameter

d = small pulley diameter

8 Belt datum length (L_d)

Calculate the belt length based on preliminary centre distance.

$$L_d = 2 \text{ CCp} + 1,57 (D + d) + \frac{(D - d)^2}{4 \text{ CCp}}$$

where

L_d = belt datum length [mm]

CCp = preliminary centre distance [mm]

D = large pulley diameter [mm]

d = small pulley diameter [mm]

Choose the closest available belt length from belt **tables** on **pages 81 to 99**.

9 Centre distance (CC)

Calculate actual centre distance based on selected belt length L_d .

$$CC = \frac{a + \sqrt{a^2 - 8(D - d)^2}}{8}$$

where

a = $2 L_d - \pi (D - d)$

L_d = selected belt datum length [mm]

D = large pulley diameter [mm]

d = small pulley diameter [mm]

10 Belt basic power rating (P_b)

Refer to power rating tables for selected belt type on **pages 41 to 62** to get the power rating values. The total belt basic power rating consists of basic power rating + power rating based on speed ratio.

Example: $P_b = 11,9 + 0,72 = 12,62$ kW

11 Correction factors (C_1 , C_3)

Refer to **table 8** for belt length correction factor C_1 and **table 7** for arc of contact correction factor C_3 .

Example: Belt length correction factor
 $C_1 = 0,97$ (interpolated)
 Arc of contact correction factor
 $C_3 = 0,96$

12 Belt power rating (P_r)

Multiply belt basic power rating with C_1 and C_3 to get the actual belt power rating.

$$P_r = P_b C_3 C_1$$

Example:

$$P_r = 12,62 \times 0,97 \times 0,96 = 11,75$$
 kW

13 Number of belts (N)

Divide drive power (design power) by power rating of selected belt to get the required number of belts.

$$N = \frac{P_d}{P_r}$$

Round up to first integer.

Example:

$$N = \frac{63}{11,75} = 5,4$$

6 SPB 2990 belts are needed

14 Installation and take-up allowances

Installation allowance **MIA** is **minimum** distance needed to decrease the CC distance in order to be able to install the belt. Take-up allowance **MTA** is **minimum** distance needed to increase the CC distance in order to tension the belt. Refer to **tables 10a** and **10b** on **page 63** to get the values.

Example:

MIA = 25 mm

MTA = 45 mm

$$C_{c \min} = 941 - 25 = 916$$
 mm

$$C_{c \max} = 941 + 45 = 986$$
 mm

15 Belt tension

Refer to **tables 11 to 18** on **pages 64 to 71** to get the recommended tension values for selected belts or follow instruction in the tensioning section to calculate tension specifically for a drive.

Example:

$d = 190$ mm

speed = 1 440 r/min

Belt section SPB

Tensioning method: SKF pen tester

Deflection force for a used run-in belt
 = 5,5 kg

Deflection force for a new belt = 8,2 kg

Service factors

Table 1

Speed increase ratio

For speed increasing drives of

- Speed ratio 1,00–1,24 multiply service factor by 1,00
- Speed ratio 1,25–1,74 multiply service factor by 1,05
- Speed ratio 1,75–2,49 multiply service factor by 1,11
- Speed ratio 2,50–3,49 multiply service factor by 1,18
- Speed ratio 3,50 and over multiply service factor by 1,25

Table 2

Types of prime mover

Soft starts

Electric motors:

- AC – Star delta start
- DC – Shunt wound
- Internal combustion engines with 4 or more cylinders
- Prime movers fitted with centrifugal clutches, dry or fluid couplings or electronic soft start devices

Heavy starts

Electric motors:

- AC – Direct-on-line start
- DC – Series and compound wound
- Internal combustion engines with less than 4 cylinders.
- Prime movers not fitted with soft start devices

Table 3

Types of driven machinery

Soft starts

Duty time h/day

10 and under Over 10 to 16 Over 16

SKF Cogged Raw Edge Wedge Belts are available up to 3 550 mm length only.

*Due to high belt flexing, only raw edge cogged belts should be used in combination with these pulleys.

■ For speeds exceeding 33 m/s, SKF recommends using dynamically balanced pulleys made of steel. Pulley diameters for 3V section are outside diameter.

Table 9u

Faster shaft speed	Rated power per belt for small pulley datum diameter [mm]														Additional power per belt for speed ratio

■ For speeds exceeding 33 m/s, SKF recommends using dynamically balanced pulleys made of steel.

Tensioning methods

Tensioning with the SKF belt tension tester

These testers provide a simple way to determine belt tension.

It is very useful in cases where no technical drive data is known which makes it impossible to calculate the appropriate tension. **Table 11** gives general tensioning values for a particular belt cross section in relation to the pulley diameter.

There are three testers (gauges) that cover most of the V-belt range:

- Gauge 1 – range: 15–70 kg
- Gauge 2 – range: 50–150 kg
- Gauge 3 – range: 150–300 kg

Instructions

- 1 Select the appropriate tester from **table 11**.
- 2 With the indicator arm down, place the tester parallel to the side of one belt along the mid section of the span length.
- 3 Holding the rubber finger loop, press down on the belt.
- 4 Stop when you feel and hear the “click”.
- 5 Remove tester and read the belt tension by observing the point where the top surface of the indicator arm crosses the numbered scale on the tester body (→ **fig. 1**).

Tensioning with the SKF pen tester

This gauge is available to determine the deflection force [kg] required to set and maintain V-belt tension.

Table 12 lists the required force needed to deflect a belt in mid-span relative to pulley diameter and speed.

- 1 Measure the span length (→ **fig. 2**)
- 2 Position the bottom of the large O ring on the pen scale at the measured span length (→ **fig. 3**)
- 3 Set the small O ring on the deflection force scale to zero
- 4 Place the tension tester squarely on one belt at the centre of the span length (→ **fig. 2**) and apply downward force to the plunger until the bottom of the large O-ring is even with the next belt or with the bottom of a straight edge laid across the pulleys.
- 5 Remove the tension tester and read the force applied with the values given in the tables. The force should be between the minimum and the maximum shown. The maximum value shown is for new belts, which will allow for anticipated tension loss. Used belts should be maintained at the minimum values indicated in the tables.

Fig. 4

Tensioning with the SKF Belt Frequency Meter

The SKF Belt Frequency Meter is used for checking the tension by means of belt natural frequency measurements (→ **fig. 4**).

Tension measurements are presented in hertz [Hz] or in newton [N], if the drive parameters are entered.

Advantages

- Precise and repeatable measurements
- Non-contact optical head with LED beam for easy pointing to belt surface
- Easy-to-use
- Wide tension range (10–400 Hz)
- Extremely fast response allows quick tension checks on multiple belt drives

Can be used in two different ways:

- a Technical data of the drive is not known and therefore the appropriate tension cannot be calculated. In such cases, refer to general tension values recommended for the particular belt in **tables 13 to 15**.
- a Drive data is known. The tensioning value can be calculated by the drive design program or by a belt tension formula. Simply measure the strand tension in the belt and compare it with the calculated value.

Instructions

- 1 Press ON/OFF to switch meter ON.
- 2 Press button UP or DOWN to select display mode indicated on left side of the display.
- 3 In case newton [N] mode is selected, then:
 - i. Enter belt specific mass [g/m] provided with operating instruction.
 - ii. Enter span length [m]
- 4 Hold the optical head up to the belt span and strum the belt slightly to make it vibrate.
- 5 Measurement is automatically performed. Read-out is given in hertz or in newton depending on selected display mode.

The values listed in the tables on the following pages provide a guideline for belt tensioning. More accurate values for your specific belt drive can be obtained from belt drive calculations on skfptp.com.

* Multiply the belt tension required for a single belt by the number of belts in the banded belt unit to get the total tension to apply.

**Multiply the mass of one belt in a band by the number of belts in the banded belt unit to get the total mass to apply.

1

Calculating belt tension

Insufficient belt tension will cause the belt to slip, which consequently generates heat, high belt temperatures and premature ageing of the belt.

Degradation of the rubber compound, caused by excessive heat, will have a significant impact on the service life of a belt.

When the tension is too high, the belt will not slip, but this will have a negative impact on the service life of the bearings and the belt.

There are two values that must be considered when tensioning a belt:

- a** T_{used} (run-in) is minimum tension on the belt that ensures minimum slip on the drive. Belt tension should ideally not drop below this value during the entire belt service life.
- b** T_{new} (initial) is maximum tension in the belt, used to initially tension a new belt. T_{new} normally decreases during the first hours of operation releasing initial high bearing loads.

General tensioning values

Tensioning values for general tensioning purposes are provided by the operating manual for selected tensioning tools. The values represent the "worst case" drives and as such, tend to be higher than the values calculated for a specific drive.

Calculating tension values

In cases where all drive data is available, it is possible to calculate the required tension instead of using the general tensioning values.

To calculate tension values, the following procedure should be used:

- a** Find the minimum required strand tension for used run-in belts using the formula:

$$v = \frac{d n}{19\,100}$$

where

- v = belt speed [m/s]
- d = pulley datum diameter [mm]
- n = speed of driver pulley [r/min]

$$T_{used} = 510 \frac{(2,2 - C_3) P_d}{C_3 N v} + \frac{M v^2}{1,11}$$

where

- T_{used} = minimum required static tension in one strand of the belt [N]
- C_3 = arc of contact correction factor (→ **table 4**)
- P_d = design power [kW]
- N = number of belts on the drive
- v = belt speed [m/s]
- M = belt weight per unit [kg/m] (→ **tables 3A, 3B, 3C**)

- b** Increase T_{used} value by 50% to get initial required tension on a new belt T_{new}

$$T_{new} = 1,5 T_{used}$$

- c** If the SKF pen tester is used to tension the drive, calculate belt deflection force.

For single V-belts and single units of banded and ribbed belts:

$$F_{d\,used} = 0.102 \times \left[\frac{T_{used} N}{16} + \frac{N K S_p}{L} \right]$$

$$F_{d\,new} = 0.102 \times \left[\frac{T_{new} N}{16} + \frac{N K S_p}{L} \right]$$

For multiple V-belts or matched sets of banded and ribbed belts:

$$F_{d\,used} = 0.102 \times \left[\frac{T_{used} N}{16} + N K \right]$$

$$F_{d\,new} = 0.102 \times \left[\frac{T_{new} N}{16} + N K \right]$$

where

- $F_{d\,used}, F_{d\,new}$ = deflection force for a used run-in respectively a new belt [kg]
- T_{used}, T_{new} = required strand tension for a used run-in respectively a new belt
- N = number of belts (for single V-belt $N = 1$) or number of belts in a band.
- K = belt modulus factor (→ **table 1**)
- S_p = span length of the belt [m]
- L = reference length of the belt [m]

- d** If the SKF Belt Frequency Meter is used to tension the drive, take value T_{new} (T_{used}) and directly compare it with the readings from the tester.

Tensioning by means of belt elongation

This method is used when installing new or used run-in banded V-belt sets or where individual belts require so much force that other tensioning methods are not practical.

Instructions

- 1 Determine strand tension (New, Used).
To do this, use general strand tension values provided in the SKF Belt Frequency Meter manual or calculate the required static strand tension.
- 2 Fit the belt on both pulleys with no tension.
- 3 Draw two lines on the back of the belt 1 000 mm apart.
- 4 Increase the distance between the two lines according to data provided in **table 17**.

If more appropriate, the following approach could be used.

- 1 Use a tape measure to measure the outside circumference of the belt.
- 2 Using the length multiplier from **table 18** and calculate the length of the belt under adequate tension.
- 3 Increase the drive centre distance until the tape measure reaches the calculated length.

Note: If you are re-tensioning a used belt, decrease the centre distance until there is no tension on the belt, then you can tape the outside.

Special drives with idlers

Use of idlers

Idlers are grooved or flat pulleys that do not transmit any power in a drive system.

Depending on the drive requirements, they can be used on either the inside or outside of the belt.

It is generally recommended to avoid any idlers on the drive as they produce additional bending stress on the belt. However, there are situations where idlers cannot be avoided. For example:

- Drives with a fix centre distance: Idlers are installed to provide required tension.
- Drives with long span: Excessive belt vibration may occur. Idlers in such cases are used as dampeners.

- Drives with low bending angle on smaller pulley, which reduces the overall power capacity of the belt: Outside idlers are then positioned close to the small pulley, which will increase the bending angle and provide better grip.

When using idlers, the following considerations should be taken into account:

- They must always be installed on the slack side of the belt. This is particularly important in case of outside idlers. An outside idler installed on tight side causes backward bend, which in combination with high belt tension, contributes to premature belt failure (→ **fig. 5**).

- Inside (grooved) idlers do not generate reverse bending of the belt thus causing less damage than backside idlers. They will, however, decrease the bending angle. Therefore, they should be positioned as close as possible to a large pulley (→ **fig. 6**). The inside diameter of an idler pulley should not be smaller than the inside diameter of the drive side pulley.
- Outside idlers should be positioned as close as possible to the small pulley to increase the bending angle (→ **fig. 7**).

Fig. 5

Fig. 6

Fig. 7

Minimum outside idler diameter should not be less than 1,3 times the diameter of the small pulley (→ **fig. 8**).

The wrapping angle of the belt around an idler should be as small as possible. Stress analyses show that, in addition to the amount of backward bend, the duration of deformation is also important. A small wrapping angle reduces the duration of deformation and has less of a negative impact on the belt (→ **fig. 9**).

Outside idlers should be cylindrical (not crowned) and should have flanges on both sides. The flanges should have sharp corners to prevent the belt from riding out of the pulley.

Fig. 8

Fig. 9

Banded belts

SKF banded V-belts are made up of two or more standard V-belts connected together on the top with a reinforced rubber band.

They are available in wedge belt constructions SPA, SPB, SPC, narrow wedge constructions 3V, 5V, 8V, and classical V-belt constructions A, B, C, D.

1 Advantages of banded V-belts

Single V-belts can handle most general drive requirements. However, under certain operating conditions, there might be an issue with belt vibrations or belt whipping, which causes the belt to come off the drive. In cases like this, banded belts offer a simple and reliable solution.

Other advantages:

- Eliminates excessive belt slip in case of heavy starts of the drive
- Prevents belts from turning over

2 Banded belts and pulleys cross reference

Generally, banded belts do not need special pulleys. Most of them run on the same pulleys as single belts.

Banded SPA, SPB, SPC belts are designed for in standard pulleys (ISO 4183). Banded 3V, 5V, 8V belts require standard RMA IP20/ISO 5290 pulleys.

The only exceptions are some A, B, C and D classic profile banded belts.

Single classical belts could run in both ISO 4183 and RMA IP20/ISO 5291 pulleys, while banded classical belts generally utilize RMA IP20/ISO 5291 pulleys only.

See **table 19** for belt pulley cross reference.

3 Tensioning of banded belts

Standard tensioning methods, by deflection load or belt frequency, may not be appropriate for tensioning a banded belt. This is particularly true for applications where there are long spans and heavy belts. To tension banded belts, SKF recommends using the belt elongation method on **page 71**.

Installation and maintenance

All SKF V-belts are produced to be set free, i.e. you can take any belt of the same designation from the shelf and put it on a multiple groove drive. Proper tensioning will compensate small length deviations and make all belts carry equal load on the drive.

Before installing a new belt, make sure that:

- 1 Pulleys are properly aligned. Maximum allowable misalignment β is $0,3^\circ$ or 5 mm / 1 m of centre distance. Values greater than those listed will reduce the belt service life and cause edge wear. Misalignment is represented by the ways shown in **fig. 10**. A straight edge should be used to check proper alignment as in **fig. 11**.

A more precise way to check alignment, particularly over long distances, is the SKF Belt Alignment Tool (\rightarrow **fig. 12**).

- 2 Make sure that all pulley grooves are of the same size. Uneven wear of grooves causes belts running on different diameter levels in the pulley. That generates excessive slip of the belts on one side and bad effects similar to mismatched belts on the other side (\rightarrow **fig. 13**).

General advice is to briefly inspect pulleys at every belt change but closely inspect and possibly replace at every third belt change. Use an SKF pulley gauge (→ **fig. 14**) to check pulley wear.

Pulleys should be replaced when more than 0,8 mm is detected between template and groove.

- 3** Never mix different brands or belt types on the same drive.

Belt lengths can differ from one manufacturer to another and different materials can have significantly different values for the coefficient of thermal contraction.

SKF also does not recommend mixing new and used belts as it may result in uneven load distribution and premature belt failure.

- 4** Never force belts over the pulley edge, since this may damage the surface and initiate a crack, which will weaken the belt and cause premature belt failure. Properly slack off and take up the drive until belts are easily placed in the grooves.

- 5** Do not rely on belt dressings to eliminate belt slippage. Belt dressings can temporarily increase friction between the belt and pulley. However, this is a temporary fix until the cause of slippage can be identified and corrected.

- 6** Tension belts according to SKF tensioning recommendations. Refer to Tensioning section on **pages 64 to 71** to review tensioning equipment available. Please note, that incorrect belt tension will cause premature belt failure. A good practice is to apply slightly higher, rather than lower, tension to the belt. General experience shows that an under-tensioned V-belt is the major cause of power loss and premature belt failure. However, be aware that excessive tension will cause premature bearing failure.

SKF recommends checking belt tension after the first 48 hours of continuous use and rechecking belt tension 3 to 4 times per year.

Fig. 14

Troubleshooting guide

Table 21

Problem	Possible causes	Solution
Belts mismatched	Used and new belts mixed	Replace with new set
	Misaligned drive	Belts are progressively tighter from one side to the other. Realign pulleys.
	Worn or badly machined pulley grooves	Replace or rework the pulleys
	Belts undertensioned	Rotate drive to get all belts slack on bottom side. Retension to required value.
Belts fail shortly after fitting	Improper belt installation	Belt levered over pulley. Follow installation instructions.
	Drive undersized	Check drive design
	Drive blocked	Remove cause
Belt vibrations	Resonant condition	Change drive dimensions (increase/decrease centre distance), use outside "kissing" idler or inside idler on belt slack side.
	High shock load	Increase tension. Use SKF banded belts.
	Pulley not balanced	Provide dynamically balanced pulleys.
Belts break and cracks	Improper outside idler size or position	Follow instructions on how to work with idlers.
	Pulley diameter too small	Belt flexing issue. Change pulley according to minimum diameter recommendations.
	Excessive heat	Remove source of heating. Use raw edge belts which resist higher temperatures. Check tension. Too loose belts will slip and cause heat.
	Chemical attack	Provide adequate protection
Belts turn over	Poor drive alignment	Realign pulleys
	Incorrect belt/pulley groove section	Match belt and pulley
	Excessive wear of pulleys	Replace or rework the pulleys
	Too low tension on belts	Increase belt tension
Belts wear rapidly	Belt hitting guard frame	Remove cause
	Starting torque too high, overloaded drive	Check drive design and redesign
	Excessive pulley groove wear	Replace or rework grooves
	Poor pulley alignment	Realign drive
	Belt tension too low	Increase belt tension
Belts slip	Drive undertensioned	Tension properly
	Drive overload	Redesign the drive
	Pulleys worn (belt bottom in groove)	Replace or rework grooves
	Excessive oil or grease	Provide better shielding on drive

* Belts have a slight variation in pitch length.
 ** 3170 (Lp) - Check availability

RAW EDGE BELTS

Belts up to and including 3500mm (Lp) may also be available in RAW EDGE COG construction. Designations are PHG XPB*** and PHG 5VX** respectively.

BANDED BELTS (SPZ/XPZ/3V/3VX and SPB/XPB/5V/5VX)

As the TRANVERSE pitch (between pulley grooves) of the ISO and RMA standards varies, a check should be made of BOTH pulleys before selecting, interchanging or using BANDED belts. Both pulleys must have the same TRANVERSE pitch dimension.

SKF HiTD Belts

Construction details

Tension members

The tension members (cords) are made from low stretch glass fibre cords.

Rubber cushion

The rubber cushion is made from a high grade chloroprene compound.

Tooth wrapping fabric

Heavy duty polyamide industrial fabric.

Features:

- Moderately oil-resistant
- Temperature range from -25 to +85 °C
- Ozone resistant
- Excellent dimensional stability
- Suitable for tropical climates

Applications

SKF HiTD Belts have been developed to accommodate all industrial applications within its power rating. For additional information about pulleys and belt crossreferences, contact the SKF application engineering service.

Standards

ISO 13050

SKF HiTD Belts			
Section	Pitch	Tooth height	Height

SKF Classical Timing Belts

Construction details

Tension members

The tension members are made from low stretch glass fibre cords.

Rubber cushion

The rubber cushion is made from a chloroprene compound.

Tooth wrapping fabric

Polyamide industrial fabric.

Features:

- Moderately oil-resistant
- Temperature range from -25 to $+85$ °C
- Ozone resistant
- Excellent dimensional stability
- Suitable for tropical climates

Applications

SKF Classical Timing Belts have been developed to accommodate all industrial applications using classical and metric timing belt pulleys.

Standards

ISO 5296-1

Example:

Driver: 25 kW electric motor,

1 470 r/min with direct online start.

Driven: Rotary compressor, 700 r/min

Service: 24 hours /day

Approximate distance between centres

= 700 mm

Tensioning method:

SKF Belt Frequency Meter

1 Service factor (C_2)

Service factors describe the severity of drive conditions. Refer to **tables 2 and 3** on **page 106**.

Example: Medium duty class, heavy start

$$C_2 = 2,0$$

For speed increasing drives, use correction factors in **table 1** on **page 106**.

2 Design power (P_d)

Multiply drive power and service factor

C_2 to get the design power.

$$P_d = P_r C_2$$

Where:

P_d = design power [kW]

P_r = motor rated power or power absorbed by the load [kW]

C_2 = service factor

Example:

$$P_d = 25 \times 2,0 = 50 \text{ kW}$$

3 Required speed ratio (I_r)

Divide speed of faster shaft with speed of slower shaft to get the required pulley speed ratio.

$$I_r = \frac{r/\text{min (faster shaft)}}{r/\text{min (slower shaft)}}$$

Example:

$$I_r = \frac{1\,470}{700} = 2,1$$

4 Belt cross section

Refer to **diagrams 1 and 2** on **page 107** for the appropriate belt cross section based on speed and design power.

Example: The diagrams suggest section 8M or 14M for the given drive parameters. As the driven machine is classified heavy start, the selected section is 14M.

5 A. If selected belt cross section is: HiTD 5M, 8M, 14M

Refer to corresponding centre distance tables **4a to 4r** on **pages 108 to 125** to get:

Belt pitch length (L_p)
Design centre distance (C_d)
Number of teeth of pulleys (Z_s, Z_l)

Example:

Centre distance table for section HiTD is available on **pages 118 to 126**.

Speed ratio: 2,1

(With reference to Table 4l on page 119, the closest ratio is 2.07)

Belt length: 2 100 mm

CC distance 735,3 mm

$Z_s = 29$

$Z_l = 60$

$d = 129,2 \text{ mm}$

$D = 267,3 \text{ mm}$

Continue with **step 10**

5 B. If another type of timing belt is selected, where centre distance tables are not available

Continue with **step 6**.

6 Pulley diameter and number of teeth (d, D, Z_s, Z_l)

- Try to use standard pulley diameters
- Refer to **table 5a** on **pages 126 and 127** to get recommended number of teeth for small pulley (Z_s)
- Refer to speed ratio **table 5b** on **pages 126 and 127** to get number of teeth for large pulley (Z_l)
- Calculate pulley diameters for small and large pulley

$$d = \frac{Z_s \text{ Pitch}}{\pi}$$

$$D = \frac{Z_l \text{ Pitch}}{\pi}$$

where

Pitch = belt pitch distance [mm]

d = pitch diameter of smaller pulley [mm]

D = pitch diameter of larger pulley [mm]

7 Nominal centre distance (C_n)

Determine nominal centre distance between pulleys from drive data sheet.

8 Belt datum length (L_d)

Calculate theoretical belt length based on nominal centre distance.

$$L_p = 2 C_n + 1,57 (D + d) + \frac{(D - d)^2}{4 C_n}$$

Where:

L_p = belt datum length [mm]

D = large pulley diameter [mm]

d = small pulley diameter [mm]

C_n = nominal centre distance [mm]

Choose closest available belt pitch length from belt tables on **pages 153 to 163**.

9 Design centre distance (C_d)

Calculate actual centre distance based on selected belt pitch length L_p .

$$C_d = \frac{a + \sqrt{a^2 - 8(D-d)^2}}{8}$$

where

$$a = 2L_p - \pi(D-d)$$

D = large pulley diameter [mm]

d = small pulley diameter [mm]

L_p = selected belt pitch length [mm]

10 Power correction factors (C_1, C_4)

- Refer to **table 7** on **page 128** for belt length correction factor C_1 . If C_1 is not listed for a specific belt type, take $C_1 = 1$
- Belt power tables consider only drives with 6 or more teeth in mesh. If less than 6 teeth in mesh, additional reduction of basic belt power rating due to excessive tooth loading is required.

Calculate number of teeth in mesh by using the following formula:

$$TIM = \frac{0,5 - (D-d)Z_s}{6C_d}$$

Where:

TIM = number of teeth in mesh

D = large pulley diameter [mm]

d = small pulley diameter [mm]

C_d = design centre distance [mm]

Z_s = number of teeth on small pulley

- Refer to **table 6** on **page 128** for teeth in mesh correction factor C_4

11 Corrected belt power rating and respective belt width (P_{corr}, W_b)

The corrected power rating is basic power rating given in power rating **tables 8a to 8p** on **pages 129 to 142** multiplied by power correction factors C_1, C_4 as defined in **step 10**.

$$P_{corr} = P_b C_4 C_1$$

The corrected power rating must be equal or greater than the design power calculated in **step 2**.

$$P_b C_4 C_1 \geq P_d$$

Minimum required basic power rating:

$$P_b = \frac{P_d}{C_4 C_1}$$

Refer to power rating **tables 8a to 8p** on **pages 129 to 142** to select the corresponding belt width W_b .

This procedure may involve some degree of trial and error iterations from **step 5 to 11** in order to reach the appropriate actual belt basic power rating.

The following rules should be followed when selecting the belt width:

- Larger pulleys mean less belt width
- Larger pulleys will increase belt life and decrease bearing load
- Belt width should not exceed small pulley diameter

Example:

Required belt basic power rating is:

$$P_b = \frac{50}{1,0 \times 1,0} = 50 \text{ kW}$$

Selected belt width $W_b = 115$ mm

Actual belt basic power for HiTD 115 =
Select value from table 8o on page 141

i.e. A 29-teeth pulley with a section 14M (40mm wide) belt has a required speed of 1,470 rpm.

$$1,440 \text{ rpm} = 20,20 \times 3,21 \text{ (width multiplier for 14M section)} = 64,84 \text{ kW}$$

$$1,500 \text{ rpm} = 20,83 \times 3,21 \text{ (width multiplier for 14M section)} = 66,86 \text{ kW}$$

This means that at a speed of 1,470 rpm, the required power is acceptable as both are greater than the required P_b 50kW.

12 Installation and take-up allowances

Installation allowance **MIA** is minimum **distance** needed to decrease the CC distance in order to be able to install the belt.

Take-up allowance **MTA** is minimum distance needed to increase the CC distance in order to tension the belt.

Refer to **table 9** on **page 143** for values.

Example:

For one flanged pulley:

MIA = 39 mm

MTA = 4 mm

CC min = 735,3 - 39 = 696,3 mm

CC max = 735,3 + 4 = 739,3 mm

13 Belt tension

Refer to the **tables 10 to 13** on **pages 144 to 148** to get the recommended tension value for selected belt or follow instructions in tensioning section to calculate tension specifically for this drive.

Example:

Tensioning method: The SKF pen tester is not applicable as the required tension is too high. The usage of the SKF Belt Frequency Meter is recommended.

Belt: PHG 2100-14M-115

Used run-in belt: 3 200 N

New belt: 4 480 N

Service factors

Table 1

Speed increase ratio

For speed increasing drives of

- Speed ratio 1,00–1,24 multiply service factor by 1,00
- Speed ratio 1,25–1,74 multiply service factor by 1,05
- Speed ratio 1,75–2,49 multiply service factor by 1,11
- Speed ratio 2,50–3,49 multiply service factor by 1,18
- Speed ratio 3,50 and over multiply service factor by 1,25

Table 2

Types of prime mover

Soft starts

Electric motors:

- AC – Star delta start
- DC – Shunt wound
- Internal combustion engines with 4 or more cylinders
- Prime movers fitted with centrifugal clutches, dry or fluid couplings or electronic soft start devices

Heavy starts

Electric motors:

- AC – Direct-on-line start
- DC – Series and compound wound
- Internal combustion engines with less than 4 cylinders.
- Prime movers not fitted with soft start devices

Table 3

Types of driven machinery

Soft starts

Duty time h/day
10 and under Over 10 to 16 Over 16

Heavy starts

Duty time h/day
10 and under Over 10 to 16 Over 16

Class	Types of driven machinery	Soft starts			Heavy starts		
		Duty time h/day 10 and under	Over 10 to 16	Over 16	Duty time h/day 10 and under	Over 10 to 16	Over 16
Class 1 Light duty	Blowers, exhausters and fans (up to 7,5 kW), centrifugal compressors and pumps. Belt conveyors (uniformly loaded).	1,3	1,4	1,5	1,7	1,8	1,9
Class 2 Medium duty	Agitators (uniform density), blowers, exhausters and fans (over 7,5 kW). Rotary compressors and pumps (other than centrifugal). Belt conveyors (not uniformly loaded), generators and exciters, laundry machinery, lineshafts, machine tools, printing machinery, sawmill and woodworking machinery, screens (rotary).	1,4	1,5	1,6	1,8	1,9	2,0
Class 3 Heavy duty	Agitators and mixers (variable density), brick machinery, bucket elevators, compressors and pumps (reciprocating), conveyors (heavy duty). Hoists, mills (hammer), pulverisers, punches, presses, shears, quarry plant, rubber machinery, screens (vibrating), textile machinery.	1,7	1,8	1,9	2,0	2,1	2,2
Class 4 Extra heavy duty	Crushers (gyratory-jaw roll), mills (ball-rod-tube).	1,9	2,0	2,1	2,3	2,4	2,5

Calculating belt tension

Insufficient belt tension causes poor tooth engagement (tooth mesh) with the pulley which generates ratcheting, heat and excessive tooth wear. Excess tension typically has no effect on tooth engagement but can have a negative impact on bearing service life.

There are two values that must be considered when tensioning a belt:

- a T_{used} (Run-in) is minimum tension on the belt providing a satisfactory mesh. Belt tension should ideally not drop below that value during the entire belt service life.
- b T_{new} (Initial) is maximum tension on the belt used to initially tension a new belt. T_{new} normally decreases during first hours of operation releasing initial high bearing loads.

General tensioning values

Tensioning values for general purpose machinery are provided by the operating manual for selected tensioning tools. The values represent the “worst case” drives and as such, tend to be higher than the values calculated for a specific drive.

Calculating tension values

In cases where all drive data is available, it is possible to calculate tension values instead of using the general tensioning values.

To calculate tension values, the following procedure should be used:

- a Calculate linear belt speed

$$v = \frac{d n}{19\,098}$$

where

- v = belt speed [m/s]
- d = pitch diameter of the motor/driver pulley [mm]
- n = speed of driver pulley [r/min]

- b Find belt pull force

$$T_{pu} = \frac{P\,1\,000}{v}$$

Where:

- T_{pu} = belt pull force [N]
- P = motor or absorbed power* [kW]
- v = belt speed [m/s]

- c Calculate centrifugal tension of the belt

$$T_c = M v^2$$

where

- T_c = belt centrifugal tension [N]
- M = mass per unit length of the belt [kg/m] – see **table 11**
- v = belt speed [m/s]

- d Calculate strand tensions

$$T_1 = T_{pu} A_{Cr} + T_c$$

$$T_2 = [T_{pu} (A_{Cr} - 1)] + T_c$$

where

T_1, T_2 = tight-side tension, slack-side tension [N]

T_{pu} = belt pull force [N]

A_{Cr} = arc of contact ratio factor

→ **table 12**

- e Get installation strand tension for a new and for a used run-in belt

$$T_{used} = 0,5 (T_1 + T_2)$$

$$T_{new} = 1,4 T_{used}$$

where

T_{used} = required installation strand tension for a used run-in belt

T_{new} = required strand tension for a new belt

Table 12

Arc of contact ratio factor

$\frac{D-d}{C} *$	A_{Cr}	$A_{Cr}-1$
0	1,070	0,070
0,1	1,080	0,080
0,2	1,090	0,090
0,3	1,095	0,095
0,4	1,100	0,100
0,5	1,115	0,115
0,6	1,130	0,130
0,7	1,145	0,145
0,8	1,160	0,160
0,9	1,180	0,180
1	1,200	0,200
1,1	1,220	0,220
1,2	1,250	0,250
1,3	1,290	0,290
1,4	1,340	0,340
1,5	1,400	0,400

*D large pulley diameter (mm)
d small pulley diameter (mm)
C centre distance (mm)

* SKF recommends using absorbed power, if known, as it will optimize the drive design.

f If an SKF pen tester is used to tension the belt, calculate belt deflection force using:

$$F_{d \text{ used}} = \frac{T_{\text{used}} + S_p}{157 \cdot L_{ps} \cdot K_n \cdot W_b}$$

$$F_{d \text{ new}} = \frac{T_{\text{new}} + S_p}{157 \cdot L_{ps} \cdot K_n \cdot W_b}$$

where

$F_{d \text{ used}}$ = deflection force for a used run-in belt [kg]

$F_{d \text{ new}}$ = deflection force for a new belt [kg]

$T_{\text{new}}, T_{\text{used}}$ = corresponding strand tensions [N]

S_p = free tangential span length [mm]

L_{ps} = belt pitch length [mm]

K_n = normalized belt modulus factor [N/mm of belt width] → **table 13**

W_b = belt width

g If the SKF Belt Frequency Meter is used to tension the belt, take value T_{new} (T_{used}) and directly compare it with the readings from the tester.

Table 13

Belt modulus factor

Section	K_n^*
–	N/mm
5M	5,05
8M	7,25
14M	10,4
20M	25,5
XL	2,56
L	4,7
H	6,61
XH	8,77
XXH	8,77

* K_n values are given in normalized form per 1 mm of belt width. Multiply K_n by belt width to get the actual modulus factor K.

*Where a drive is very overbelted, it is advisable to enter the T_{pu} calculation with increased power, e.g. power that will utilize 100% of belt capacity. Failure to do this will result in too low calculated tension, which does not result in enough initial belt stretch to have proper teeth meshing.

Installation and maintenance

- 1 Make sure the pulleys are properly aligned. Overall misalignment is usually a combination of parallel misalignment β and angular misalignment α (\rightarrow fig. 1). The maximum allowable misalignment is $1/3$ degree. Higher values will cause tooth wear and reduce belt life. SKF recommends checking the pulleys when the drive is tensioned, since this will indicate misalignment from shaft deflections.
- 2 Check that pulleys are not worn. Inspect for erosion, which may be seen as pockets on the driving of the pulley (\rightarrow fig. 2).
Pulleys should be inspected every time a new belt is installed. They are consumable items and should be changed at the third belt installation or sooner if operating under severe conditions.
- 3 How to install timing belts?
 - Inspect pulleys and alignment
 - Install new belt over the pulleys
 - Measure the span length
 - Lengthen the centre distance or adjust the idler to set tension to a specific value
 - Use one of the methods described in tensioning chapter for timing belts
 - If possible, run the drive for approximately 5 minutes with or without load to take majority of tension decay
 - Re-tension to new belt tension value
 - Recheck belt tension, alignment and capscrew torque of tapered bushings after 8 hours of operation.
- 4 Maintenance
Periodic inspection is recommended. Factors to look for:
 - Belt tension – re-tension to previously used run-in belt tension if needed.
 - Belt condition – see section *Troubleshooting guide* on **page 152**.
 - Check alignment with the SKF Belt Alignment Tool
 - Check pulley conditions

Troubleshooting guide

Table 15

Timing belt failure and troubleshooting guide

Problem	Possible causes	Solution
Excessive edge wear	Misaligned drive	Check pulley alignment
	Belt too wide	Check belt/pulley compatibility
	Bent or rough flange	Replace or repair the pulley
	Belts undertensioned	Check belt tension
Tooth shear	Excessive load, shock on the drive	Check drive design (power rating)
	Worn pulleys or excessive pulley runout	Replace pulleys
	Incorrect match of belt and pulleys	Check belt/pulley compatibility
	Belt overtensioned or undertensioned	Check belt tension
	Less than 6 teeth in mesh	Redesign the drive
Excessive tooth wear	Belt overtensioned or undertensioned	Check belt tension
	Excessive load	Check drive design (power rating)
	Misalignment	Check pulley alignment
	Worn pulleys	Replace pulleys
	Incorrect match of belt and pulleys	Check belt/pulley compatibility
Belts break	Damage of glass cord due to handling.	Follow proper handling procedure
	Debris in pulley, drive exposed to debris	Clean pulleys and protect drive
	Excessive load	Check drive design (power rating)
Backside cracks on the belt	Pulley diameter too low	Follow recommendations for minimum pulley diameter
	Backside idler	Use inside idler or increase backside idler diameter
	Belt runs out of temperature range	Try to control conditions
Excessive drive noise	Misalignment	Check pulley alignment
	Belt overtensioned or undertensioned	Check belt tension
	Too high belt speed (> 33 m/s)	Redesign the drive
	Excessive load	Check drive design (power rating)
Improper tracking	Misalignment	Check pulley alignment
	Too high centre distance (> 8× small pulley diameter)	Redesign the drive

3.0 Additional information

Storage of power transmission belts	168
Design optimization	169

Storage of power transmission belts

Proper storage of industrial and automotive belts like V-belts and timing belts is important for users and distributors as well as belt manufacturers.

Stored under proper conditions, good quality belts will retain their material properties and work well in the application. In general, they need to be stored in a cold and dry environment with no direct sunlight.

Other important conditions are :

- Use suitable containers, do not store directly on the floor.
- Avoid areas where evaporating solvents or other chemicals are present in the atmosphere.

V-belts

V-belts are normally stored in two different ways, flat on the side on shelves or hanging on pegs mounted on the wall. Storing belts, flat on shelves, is the best way but requires more storage space.

If the second option is used, you need to make sure that the pegs are large enough to prevent the weight to cause deformation. Longer V-belts may be coiled in loops.

Table 16 provides information regarding the recommended number of loops for each belt type and size.

Banded belts

Similar to other belt types, banded belts are best stored flat on shelves. However, if they are stored on large pegs on the wall, precautions should be taken to avoid deformation.

Further, these belts are normally shipped in a "nested" configuration. It is recommended that the belts be stored in this manner as well. Nests are formed by laying a belt on its side on a flat surface and placing as many belts inside the first belt as possible without undue force.

When the nests are tight and stacked with each rotated 180° from the one below, they may be stacked without damage. Belts of this type over approximately 120 inches may be "rolled up" and tied for shipment. These rolls may be stacked for easy storage. Care should be taken to avoid a small bend radius which could damage the belts.

Timing belts

Sharp bends and crimping as well as excess weight on the belts should be avoided.

For belts up to 3 000 mm length, SKF recommends storing them flat on shelves if possible in a "nested" configuration.

Storing conditions

The belts, material properties, shape and quality should remain unchanged for 7 years if they are stored according to the recommendations above, together with the following limitations for temperature and humidity.

- Temperature should not be higher than 30 °C.
- Relative humidity should be below 70%.

Temperatures above 30 °C will reduce the expected shelf life according to the following guideline.

- Every increase of 8 °C will reduce the shelf life by half.

Storage temperatures above 46 °C are not allowed at all. An increase in humidity will not cause serious material damage but could lead to higher initial stretch of the belt on the drive.

Table 16

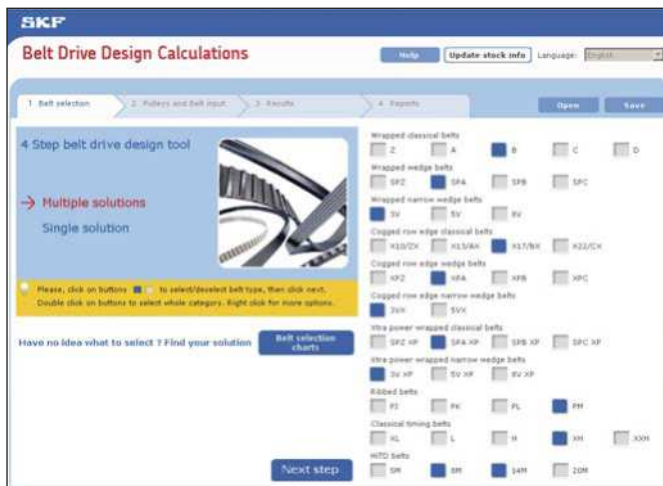

Maximum number of coilings of V-belts

Section	Belt length 76,2	Number of coils 101,6	Number of loops
–	mm	–	–
Z, ZX, A, AX, B, BX, 3V, 3V-XP, 3VX, SPZ, SPZ-XP, SPA, SPA-XP	< 1 500	0	1
	1 500–3 000	1	3
	3 000–4 500	2	5
	> 4 500	3	7
C, CX, SPB, SPB-XP, XPB, 5V, 5V-XP, 5VX	< 1 800	0	1
	1 800–3 500	1	3
	3 500–6 000	2	5
	> 6 000	3	7
SPC, SPC-XP, XPC	< 3 000	0	1
	3 000–6 000	1	3
	6 000–8 500	2	5
	> 8 500	3	7
D, 8V, 8V-XP	< 4 300	0	1
	4 300–7 000	1	3
	7 000–10 000	2	5
	> 10 000	3	7

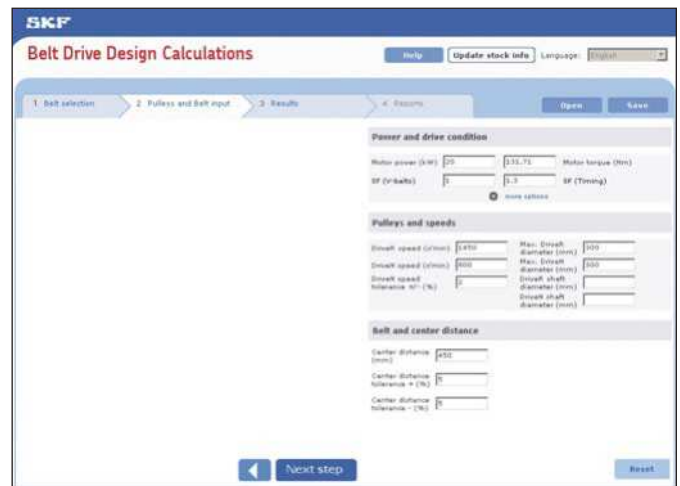

Design optimization

Belt drive calculation program

Using your data, the program will select the most efficient and economical solution for your application. At the end of your calculation, you are able to print and save a complete report for your documentation. The calculation tool can be found at www.skfptp.com, under belt drives.

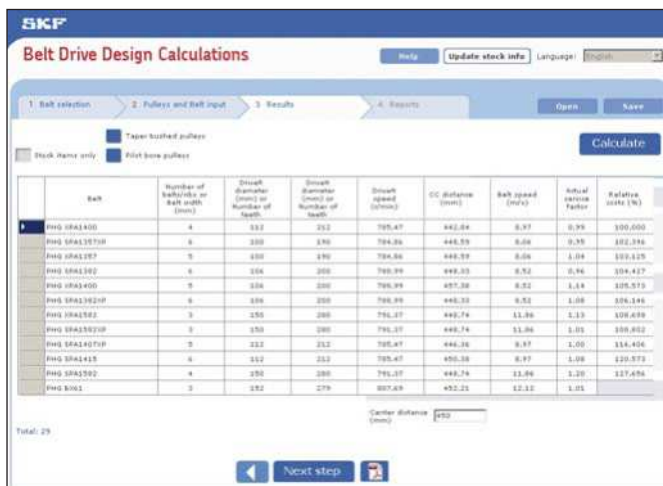

Step 1. Choose multiple or single solution calculations to start the program. The calculation based on single solutions is mainly used to check existing belt drives. For multiple solutions, you can either select belts by yourself or the program will give you a list of possible belt types.

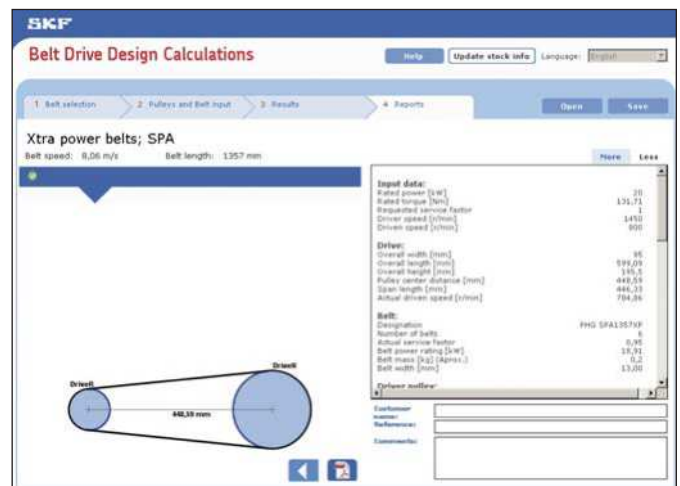

Step 2. Fill in basic application data, such as:

- Power and drive conditions
- Speeds and maximum pulley diameters
- Shaft diameters (if known)
- Centre distance

Based on your input, the system will provide a list of recommended solutions for your application.

The program will provide a full report about your selection that you can print and save as documentation.
