

# OKFX – friction-coated flange coupling from SKF

# OKFX – friction-coated flange coupling from SKF

Friction-coated OKFX couplings facilitate new creative solutions for the shaft line, while taking full advantage of time-saving SKF oil injection technology in areas where this was not previously possible.

The couplings are a milestone in the development of advanced technology, and have strengthened SKF Coupling Systems' position as the world leader in shaft connections based on the SKF oil injection method.

Thanks to the increased transmission capacity, it is possible to make substantial cost savings in the shaft line using OKFX couplings. Large flange couplings can be replaced. Costly reinforcement sleeves can be avoided. These are just two examples demonstrating that OKFX couplings are not merely clever connections with a quick payback.

The inner sleeve of each coupling is coated with carbides utilizing advanced plasma technology. This coating increases friction considerably and gives the OKFX couplings a number of advantages over other current techniques.

Compared with conventional OK flange couplings (OKF), OKFX couplings have an advanced flange design. Instead of having the flange on the outer sleeve, it is part of the inner sleeve. With this innovative design feature, the flanges are locked against each other during the mounting procedure, enabling less complex and more efficient mounting.

## Increased torque capacity means safer connections

Since the torque capacity is some 50% higher, these couplings can withstand heavy shock forces and fast rotation switches. It is therefore possible to take advantage of the time-saving oil injection method in transmissions where this was previously difficult, for instance in large heavily loaded shafts.

## A compact coupling that optimizes shaft design

OKFX couplings transfer higher torque, making it possible to optimize the design of shaft lines. This enables the use of smaller shaft diameter or coupling length, to transfer the required torque.

## Reduced coupling pressure creates opportunities for innovative solutions

Since the friction is higher, the surface pressure of the coupling can be reduced. This is particularly valuable when hollow shafts are connected. Reinforcement sleeves are therefore not necessary, which can result in significantly lower costs together with production savings.

### Benefits compared to conventional OKF couplings

- 50% higher torque capacity
- Reduced drive shaft weight
- Smaller dimensions
- Less shaft pressure
- More space for bolt mounting

### Benefits compared to traditional flange couplings arrangements

- Savings in shaft design and preparation
- Lower cost of mounting and dismounting
- Shorter downtimes
- Ease of maintenance

## Friction-coated flange couplings

# OKFX 150 – 420

The couplings can be delivered: Without flange holes,  
with prebored holes, or with the final dimension of holes.

OKFX – friction-coated flange coupling from SKF for optimized shaft design

SKF Coupling Systems AB was established in the early 1940s when SKF's Chief Engineer, Erland Bratt, invented the SKF oil injection method. As a result of continuous development, SKF is currently a world leader in selected market niches.

Our business concept is to develop, produce and supply products based on the SKF oil injection method. These products significantly reduce downtime and decrease maintenance costs of the capital intensive equipment in which they are used.
